AMENDMENTS TO THE CLAIMS

Please amend the claims as follows.

- 1. 30. (Cancelled)
- 31. (Currently Amended) A system for translating domain names comprising:
 - a Uniform Resource Locater (URL) detection module, configured to:
 - receive a URL request by a user to access a destination fully qualified domain name (FODN), and

determine that the URL request is an invalid URL request when the URL request is inconsistent with a predefined URL stored in a cookie, wherein the predefined URL stored in the cookie is specified by the user;

a URL redirection module, configured to:

receive the invalid URL request from the URL detection module, and redirect the invalid URL request to a FODN translation module; and

the FODN translation module, configured to:

translate the invalid URL request to a target valid FQDN using a FQDN mapping module, wherein the FQDN mapping module is stored on a computer readable storage medium.

- 32. (Currently Amended) The system of claim 31, further comprising:
 - a FQDN default setter configured to provide a <u>predefined</u> default target valid FQDN, wherein the FQDN default setter is used by the FQDN mapping module.
- 33. (Previously Presented) The system of claim 31, wherein the FQDN mapping module is configured to provide a mapping between the invalid URL request and the target valid FQDN.
- 34. (Previously Presented) The system of claim 31, wherein the URL request comprises an alias, wherein the alias is stored in the FODN mapping module.

Application No.: 10/618,035

- 35. (Previously Presented) The system of claim 34, wherein the FQDN mapping module comprises a mapping of the alias to the target valid FQDN.
- 36. (Previously Presented) The system of claim 31, wherein the URL detection module, the URL redirection module, and the FODN translation module execute in a browser.
- 37. (Currently Amended) A method for translating domain names, comprising: receiving, by a Uniform Resource Locater (URL) detection module, a URL request from a user to access a destination fully qualified domain name (FODN), and
 - determining, by the URL detection module that the URL request is an invalid URL request when the URL request is inconsistent with a predefined URL stored in a cookie, wherein the predefined URL stored in the cookie is specified by the user;
 - receiving, by a URL redirection module, the invalid URL request from the URL detection module;
 - redirecting, by the URL redirection module, the invalid URL request to a FQDN translation module;
 - translating, by the FQDN translation module, the invalid URL request to a target valid FQDN using a FQDN mapping module; and
 - directing the user to a web site associated with the target valid FQDN.
- 38. (Currently Amended) The method of claim 37, further comprising: providing a <u>predefined</u> default target valid FQDN by a FQDN default setter, wherein the FQDN default setter is used by the FQDN mapping module.
- 39. (Previously Presented) The method of claim 37, wherein the FQDN mapping module is configured to provide a mapping between the invalid URL request and the target valid FQDN.
- 40. (Previously Presented) The method of claim 37, wherein the URL request comprises an alias, wherein the alias is stored in the FQDN mapping module.
- 41. (Previously Presented) The method of claim 40, wherein the FQDN mapping module comprises a mapping of the alias to the target valid FQDN.

Application No.: 10/618,035

- 42. (Currently Amended) The method of claim 37, wherein the URL detection module, the URL redirection module, and the FQDN translation module execute in a browser.
- 43. (Currently Amended) A computer readable medium comprising executable instructions for translating domain names by:
 - receiving, by a Uniform Resource Locater (URL) detection module, a URL request from a user to access a destination fully qualified domain name (FODN), and
 - determining, by the URL detection module that the URL request is an invalid URL request when the URL request is inconsistent with a predefined URL stored in a cookie, wherein the predefined URL stored in the cookie is specified by the user;
 - receiving, by a URL redirection module, the invalid URL request from the URL detection module:
 - redirecting, by the URL redirection module, the invalid URL request to a FQDN translation module:
 - translating, by the FQDN translation module, the invalid URL request to a target valid FODN using a FODN mapping module; and
 - directing the user to a web site associated with the target valid FODN.
- 44. (Currently Amended) The computer readable medium of claim 43, further comprising: providing a <u>predefined</u> default target valid FQDN by a FQDN default setter, wherein the FQDN default setter is used by the FQDN mapping module.
- 45. (Previously Presented) The computer readable medium of claim 43, wherein the FQDN mapping module is configured to provide a mapping between the invalid URL request and the target valid FQDN.
- 46. (Previously Presented) The computer readable medium of claim 43, wherein the URL request comprises an alias, wherein the alias is stored in the FQDN mapping module.
- 47. (Previously Presented) The computer readable medium of claim 46, wherein the FQDN mapping module comprises a mapping of the alias URL request to the target valid FQDN.

Application No.: 10/618,035 Docket No.: 03226/493002; SUN040039

48. (Previously Presented) The computer readable medium of claim 43, wherein the URL detection module, the URL redirection module, and the FQDN translation module execute in a browser.
